

The NAREWAMA pot riser for panel cookers

Generally, best cooking results are obtained, once the solar energy is distributed all over the **entire** surface of the pot. Hence, it is essential to rise the pot once you apply solar panel cookers, e.g. CookKit, LightOven, Diamond, etc., to allow the solar energy to radiate to the pot from underneath.

To manufacture your own pot riser, cut a coat hanger as shown below and bend the wire accordingly. The pot riser can be used as a trivet as well.
